

# Web Application Penetration Test

**Rory Leanord**

CMP319: Ethical Hacking 2

BSc Ethical Hacking Year 3

2020/21

All work conducted during Unit 2 of the Ethical Hacking Coursework is highlighted in **Light Grey**.

Work Conducted for Unit 2 of the Ethical Hacking 2 Coursework can be found in The Abstract Sections 3 & 4. References used during Unit 2 investigation can be found in References Uni 2.

## Abstract

---

Web applications are used daily by millions of people worldwide. With the increasing complexity of these web applications, security is more paramount than ever, and the security demand on each application is ever increasing. A web application test is conducted on the web application Hacklab Security, to determine if there are any security improvements and/or countermeasures that can be implemented.

This report covers a web application penetration test using the OWASP Web Application Penetration Testing Methodology. This methodology ensures that a complete and thorough penetration test is completed, as well as producing a report, which documents all the vulnerabilities found within the web application.

The Hacklab Security web application was found to have multiple critical vulnerabilities. The most notable of which are; SQL injection, Cross-Site Scripting, and weak user authentication

# 1 INTRODUCTION

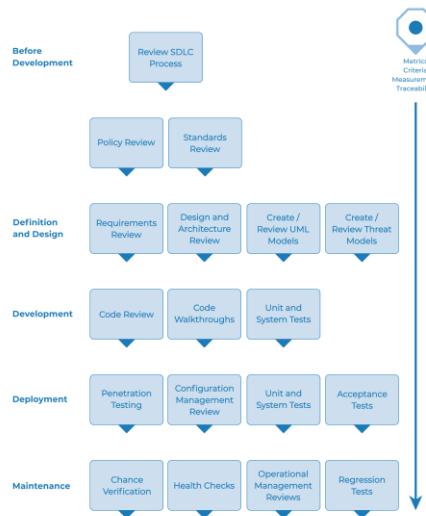

## 1.1 BACKGROUND

The security of a web application is an essential part of managing a website. A penetration test is to be conducted on the site <http://192.168.1.20/>. An assessment of the security of the application and testing for any known exploits and potential security risks will be conducted. The testing will be limited to the web application and not the operating system or hardware that the application is hosted on.

The application being tested is “Hacklab Security”, which is an online store selling security cameras. Prior to starting the test, the following credentials were provided;

<u>Username</u>	<u>Password</u>
<a href="mailto:hacklab@hacklab.com">hacklab@hacklab.com</a>	hacklab

To conduct a thorough and accurate test, the OWASP Web Application Penetration Testing Methodology was implemented. Due to the application not being locally hosted and not publicly available, certain sections of the methodology have been omitted as, the OWASP Methodology is designed to be used in a wide variety of situations and tests and therefore certain sections don't apply. Due to the OWASP methodologies wide usage by both companies and individuals, it is constantly being updated and as such remains relevant.

The OWASP methodology systematically goes through the web application testing for any possible vulnerabilities. It does this in 11 stages, each stage containing an essential step within the penetration test.

## **1.2 AIM**

---

The goals of this project are:

- Conduct a thorough web application penetration test using the OWASP methodology.
- Uncover vulnerabilities that are present within the web application.
- Produce a report based off the methodology used, detailing the findings of the Penetration test.

## 2 PROCEDURE AND RESULTS

### 2.1 OVERVIEW OF PROCEDURE

---

This report will follow the OWASP methodology, which contains 11 stages. Each stage is broken down into smaller steps throughout the methodology, and are as follows;

1. Information Gathering
2. Configuration and Deployment Management Testing
3. Identify Management Testing
4. Authentication Testing
5. Authorisation Testing
6. Session Management Testing
7. Input Validation Testing
8. Error Handling
9. Cryptography
10. Business Logic Testing
11. Client-Side Testing

These steps provide a clear overview of the testing conducted and ensures that no aspect of testing is missed. The tools that will be used throughout the test are as follow;

HTTPPrint	Nmap
Dirb	Nikto
whatWeb	CyberChef
OWASP ZAP	OWASP Mantra
SQL Map	BeEF

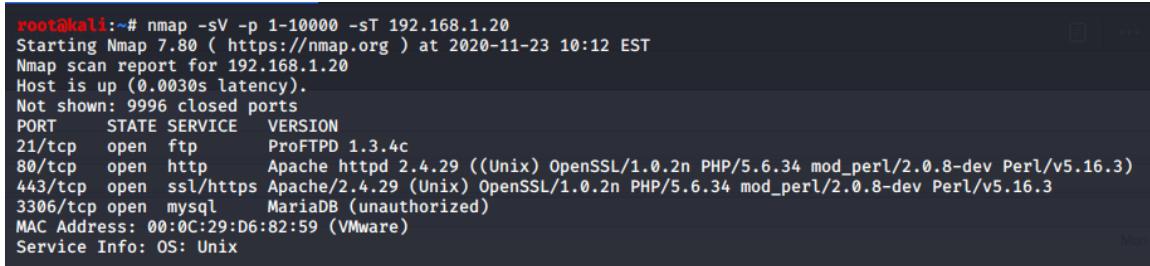

## 2.2 INFORMATION GATHERING

---

Information gathering is an essential part of any web application penetration test. The more learned about the web application the more likely a vulnerability is to be uncovered and reported.

### 2.2.1 Fingerprinting Web Server

Outlined in the OWASP methodology, foot printing the server is a crucial first stage in a web application penetration test. Foot printing allows the penetration tester to identify the operating system and services that are running, as well as the versions. The first tool used was Nmap, a scan was run against 192.168.1.20, as seen in figure A. The scan revealed open ports, along with the webserver that is running. This scan revealed the web server to be running on Apache/2.4.29 along with a MariaDB database.

```
root@kali:~# nmap -sV -p 1-10000 -sT 192.168.1.20
Starting Nmap 7.80 ( https://nmap.org ) at 2020-11-23 10:12 EST
Nmap scan report for 192.168.1.20
Host is up (0.0030s latency).
Not shown: 9996 closed ports
PORT      STATE SERVICE VERSION
21/tcp    open  ftp     ProFTPD 1.3.4c
80/tcp    open  http    Apache httpd 2.4.29 ((Unix) OpenSSL/1.0.2n PHP/5.6.34 mod_perl/2.0.8-dev Perl/v5.16.3)
443/tcp   open  ssl/https Apache/2.4.29 (Unix) OpenSSL/1.0.2n PHP/5.6.34 mod_perl/2.0.8-dev Perl/v5.16.3
3306/tcp  open  mysql   MariaDB (unauthorized)
MAC Address: 00:0C:29:D6:82:59 (VMware)
Service Info: OS: Unix

Nmap done: 1 IP address (1 host up) scanned in 1.02 seconds
```

Figure A – NMap Scan

To ensure the accuracy of the NMap scan, multiple other fingerprinting methods were conducted. These included the use of NMap scripts, and tools such as HTTPPrint and HTTPRecon. The results of these can be found in appendix A. The scans further confirmed that the server is running Apache 2.4.29, on a Unix operating system.

### 2.2.2 Review Webserver Metafiles

After discovering the webserver that the web application was running on, the next stage is to review the webservers metafiles. This can be done by navigating to <http://192.168.1.20/robots.txt> and analyzing it for any information leakage, seen in figure B. This revealed an attempt to hide the folder /company-accounts. Upon navigating to this folder, a zip file and a text file can be found containing finances for the web application. These can be found in Appendix B.

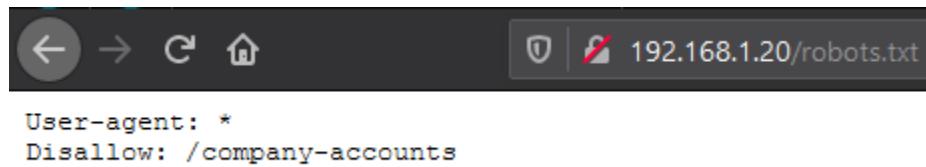

Figure B – robots.txt

### 2.2.3 Enumerate Applications on Webserver

To ensure that there are no unusual ports open on the web server, the following NMap scan was run; nmap -sT -sV -p 1-65535 -sT 192.168.1.20 was ran. This showed that only the standard ports for a web application were open, seen in Figure C.

```

root@kali:~# nmap -sT -sV -p 1-65535 -sT 192.168.1.20
Starting Nmap 7.80 ( https://nmap.org ) at 2020-11-29 07:44 EST
Nmap scan report for 192.168.1.20
Host is up (0.010s latency).
Not shown: 65531 closed ports
PORT      STATE SERVICE VERSION
21/tcp    open  ftp      ProFTPD 1.3.4c
80/tcp    open  http     Apache httpd 2.4.29 ((Unix) OpenSSL/1.0.2n PHP/5.6.34 mod_perl/2.0.8-dev Perl/v5.16.3)
443/tcp   open  ssl/https Apache/2.4.29 (Unix) OpenSSL/1.0.2n PHP/5.6.34 mod_perl/2.0.8-dev Perl/v5.16.3
3306/tcp  open  mysql   MariaDB (unauthorized)
MAC Address: 00:0C:29:D6:82:59 (VMware)
Service Info: OS: Unix

Service detection performed. Please report any incorrect results at https://nmap.org/submit/ .
Nmap done: 1 IP address (1 host up) scanned in 33.68 seconds
root@kali:#

```

Figure C – NMap Application Enumeration

#### 2.2.4 Review Webpage Comments and Metadata for Information Leakage

To review the comments within the web application, the source code was manually reviewed. Upon review of the source code, no unusual comments were found. The comments present were comments describing how the code was laid out, as can be seen in Figure D.

```

<head>
  <meta charset="utf-8">
  <link rel="shortcut icon" href="img/aalogo.jpg">
  <title>Hacklab Security</title>
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="">
  <meta name="author" content="">
  <!--Less styles <link rel="stylesheet/less" type="text/css" href="less/bootstrap.less"> <script src="less.js" type="text/javascript"></script>-->
  <!--Le styles-->
  <link href="assets/css/bootstrap.css" rel="stylesheet">
  <link href="assets/css/bootstrap-responsive.css" rel="stylesheet">
  <link href="assets/css/docs.css" rel="stylesheet">
  <link href="assets/style.css" rel="stylesheet">
  <link href="assets/js/google-code-prettify/prettify.css" rel="stylesheet">
  <script type="text/javascript"><!--&lt;/script&gt;
  &lt;script&gt;<!--&lt;/script&gt;
  &lt;script src="//ajax.googleapis.com/ajax/libs/jquery/1.9.1/jquery.min.js"&gt;&lt;/script&gt;
  &lt;script src="js/incrementing.js"&gt;&lt;/script&gt;
  &lt;!--Le HTML5 shim, for IE6-8 support of HTML5 elements--&gt;
  &lt;!--[if lt IE 9]&gt; &lt;script src="http://html5shim.googlecode.com/svn/trunk/html5.js"&gt;&lt;/script&gt; &lt;![endif]--&gt;
  &lt;!--&lt;style&gt;<!--&lt;/style&gt;
  &lt;!--Le fav and touch icons--&gt;
</pre>

```

Figure D – head tag of [http://192.168.1.20/product\\_summary.php](http://192.168.1.20/product_summary.php)

#### 2.2.5 Identify Application Entry Points

To identify possible weaknesses in the application, a manual search for all the possible entry points within the web application was conducted. By doing so it allows the discovery of areas of interest to be investigated more thoroughly further in the report. The identified entry points are as follows;

- Login – Email
- Login – Password
- Register – First Name
- Register – Middle Name
- Register – Last Name
- Register – Email
- Register – Password
- Register – Confirm Password
- Register – Address
- Register – Contact Number
- Products – Search Bar

Once a user has logged in, within the authenticated user section there are also;

- Email – Compose – Subject
- Email – Compose – Message
- Shopping Cart – Shipping Address
- Announcement – Comment
- Edit Profile – First Name
- Edit Profile – Middle Name
- Edit Profile – Last Name
- Edit Profile – Address
- Edit Profile – City
- Edit Profile – Contact Number
- Edit Profile – Email
- Edit Profile – New Password

Alongside the manual search of the web application, the source code was analyzed for all form tags, as well as all POST/GET requests. Due to the nature of POST requests being used to transfer data to the server, they are an essential part of a web application.

## 2.2.6 Map Execution Paths Through Application

To map the execution paths throughout the application, OWASP Zap was used. OWASP Zap finds all the URLs associated with a domain/IP, in this case <http://192.168.1.20>, through spidering though the web application. OWASP Zap uncovered 147 URLs. The full list of URLs can be found in Appendix C.

The screenshot shows the OWASP Zap interface with the 'URLs' tab selected. The main pane displays a table of URLs with the following columns: Processed, Method, URI, and Flags. The table lists 147 URLs, mostly marked as 'Seed' (green), with a few marked as 'Out of Scope' (red). The URIs include various static files like robots.txt, sitemap.xml, and CSS/JS files, as well as dynamic pages like index.php and register.php.

Processed	Method	URI	Flags
●	GET	http://192.168.1.20	Seed
●	GET	http://192.168.1.20/robots.txt	Seed
●	GET	http://192.168.1.20/sitemap.xml	Seed
●	GET	http://192.168.1.20/company-accounts	
●	GET	http://192.168.1.20/	
●	GET	http://192.168.1.20/index.php	
●	GET	http://192.168.1.20/products.php	
●	GET	http://192.168.1.20/contact.php	
●	GET	http://192.168.1.20/aboutus.php	
●	GET	http://192.168.1.20/register.php	
●	GET	http://192.168.1.20/company-accounts/	
●	GET	http://192.168.1.20/img/aalogo.jpg	
●	GET	http://192.168.1.20/bootstrap/css/bootstrap.min.css	
●	GET	http://192.168.1.20/assets/css/bootstrap-responsive.css	
●	GET	http://192.168.1.20/assets/css/docs.css	
●	GET	http://192.168.1.20/assets/js/google-code-prettify/prettify...	
●	GET	http://html5shim.googlecode.com/svn/trunk/html5.js	Out of Scope
●	GET	http://platform.twitter.com/widgets.js	Out of Scope
●	GET	http://192.168.1.20/assets/js/jquery.js	
●	GET	http://192.168.1.20/assets/js/google-code-prettify/prettify...	
●	GET	http://192.168.1.20/assets/js/application.js	
●	GET	http://192.168.1.20/assets/js/bootstrap-transition.js	
●	GET	http://192.168.1.20/assets/js/bootstrap-modal.js	

Figure E – OWASP Zap

The next stage after the OWASP Zap scan is a brute force attack. This is done to find hidden folders, URLs and files, as well as to ensure no information is missed. The tool Dirb was used to execute the brute force attack. A small section of the results can be viewed in Figure F, the full results can be seen in Appendix D. Nikto was also used to ensure that all possible URLs were discovered, the full results can be found in Appendix E.

OSVDB-3268: GET /database/: Directory indexing found.
OSVDB-3093: GET /database/: Databases? Really??
```

Figure G - Nikto Scan

## 2.2.7 Fingerprint Web Application Framework

Fingerprinting the framework of the application is an important step with a web application penetration test. Knowing the type of framework present within an application can allow for an advantage within the penetration test. With the use of a Nikto scan, multiple shortcomings were found within the framework, such as the lack of X-XSS-Protection headers, anti-clickjacking X-Frame-Options not being present and X-Content-Type-Options, as can be seen in Figure H. The full results can be found in Appendix E.

```
+ GET Retrieved x-powered-by header: PHP/5.6.34
+ GET The anti-clickjacking X-Frame-Options header is not present.
+ GET The X-XSS-Protection header is not defined. This header can hint to the user agent to protect against some forms of XSS
+ GET The X-Content-Type-Options header is not set. This could allow the user agent to render the content of the site in a different
fashion to the MIME type
```

Figure H - Nikto Scan

## 2.2.8 Fingerprint Web Application

The tool whatweb was used to fingerprint the web applications. The results show what the main parts of the web application are. In this case its revealed JQuery, PHP 5.6.34 and OpenSSL 1.0.2n being active within the application this can be seen in Figure I.

```
root@kali:~# whatweb 192.168.1.20
http://192.168.1.20 [200 OK] Apache[2.4.29][mod_perl/2.0.8-dev], Country[RESERVED][ZZ], Email[sales@UADHacklab.com],
HTTPServer[Unix][Apache/2.4.29 (Unix) OpenSSL/1.0.2n PHP/5.6.34 mod_perl/2.0.8-dev Perl/v5.16.3], IP[192.168
.1.20], JQuery, Lightbox, OpenSSL[1.0.2n], PHP[5.6.34], PasswordField[password], Perl[5.16.3], Script[text/javascript],
Title[Hacklab Security], X-Powered-By[PHP/5.6.34]
root@kali:~#
```

Figure I – WhatWeb

### 2.3.2 Test File Extensions Handling For Sensitive Information

Forced browsing to files, to check URLs and find sensitive information is a common technique to ensure that all public URLs are uncovered. Using tools such as Nikto, Dirb and OWASP Zap allow for all the public URLs to be discovered. The full results for these can be found in Appendixes E, D and C respectively. Some URLs of note are;

```
/database/ - Allowed for the database download  
/admin/ - The admin login panel  
/phpinfo.php – Exposed the PHP information of the server  
/info.php - Exposed the PHP information of the server  
/admin/ADMIN/ - Allowed for the navigation to any of the four admin types
```

These URLs allow for access to the admin panel, with no authentication. This will be used later in the penetration test.

### 2.3.3 Test HTTP Strict Transport Security

HTTP Strict Transport Security header is a mechanism that forces browsers to transport exclusively over HTTPS. The test for this is;

```
curl -s -D- http://192.168.1.20 | grep Strict
```

If some form of result is displayed, the HSTS header is present. As can be seen in Figure L, no response is given.

```
root@kali:~# curl -s -D- http://192.168.1.20 | grep Strict  
root@kali:~#
```

Figure L – HSTS

## 2.4 IDENTITY MANAGEMENT TESTING

---

### 2.4.1 Test Roll Definitions

Throughout the OWASP methodology, 6 different user types are defined, these are;

- Super Admin
- Administrator
- Editor
- Author
- Contributor
- Subscriber

However, for this web application there are different admin accounts, these admin accounts can be seen in Figure M. Alongside these admin accounts, there is a regular user account type, which have permissions to add things to cart and checkout.

Database: aa2000	
Table: user_type	
[4 entries]	
+-----+	
typeID	user_type
+-----+	
1	ADVERTISING Admin
2	ASSET Admin
3	ONLINE ORDERING Admin
4	SUPER Admin
+-----+	

Figure M – Admin types

### 2.4.2 Testing User Registration

The registration process for the web application is a form with little to no checks verifying if the account is legitimate, as seen in Figure M. The only validation present are in the fields email, password and Contact Number. These checks are as follows;

Email – Must have an @ in the text

Password – Must be between 7 and 14 characters (password entered “qwerty123”)

Contact Number – Must only be numbers

**Your personal information**

Gender	Male
First name *	a
Middle name *	a
Last name *	a
Email *	a@a.com
Password *	*****
Confirm Password *	*****
Date of Birth *	12 / 11 / 1997

**Your address**

Address *	a
City *	Manila
Contact Number *	123456789

**Register**

Figure N – User Registration

After registering, the user has full access to the user section of the web application. Additionally, the same email account cannot be used to register multiple accounts. In Figure M you can see the created account logged in.

Figure O - Logged In created Account

## 2.5 AUTHENTICATION TESTING

---

### 2.5.1 Testing for Credentials Transported over an Encrypted Channel

The application is transmitting all the user's requests through HTTP, in plain text, instead of HTTPS, where the information would be encrypted. Using OWASP Zap it can be seen that all traffic is going through HTTP, this can be seen in Figure P. This in turn means that the application isn't secure and is vulnerable to sniffing tools and interception, which can allow for user's data to be stolen.

9,298	30/11/20 11:06:10	GET	http://192.168.1.20/contact.php	200	OK
9,300	30/11/20 11:06:11	GET	http://192.168.1.20/products.php	200	OK
9,301	30/11/20 11:06:14	GET	http://192.168.1.20/aboutus.php	200	OK
9,302	30/11/20 11:06:15	GET	http://192.168.1.20/aboutus.php	200	OK

Figure P - OWASP Zap HTTP

Burp suite community was used to check if the data transferred is encrypted or unencrypted. To do this the Burp suite proxy was used. As can be seen in Figure Q, the username and password transferred to the server in plain text.

```

Figure Q - Burp Proxy

### 2.5.2 Testing for default Credentials

To test for default login credentials, possible default logins were manually inputted and tested. These test logins were as follows;

test@test.com  
user@test.com  
user@user.com  
admin@admin.com

As can be seen in Figure R, a different error was returned for test@test.com, suggesting there is an account with that username. All other test accounts returned the error that can be seen in Figure S. After attempting to guess the password for test@test.com, the password was "123456789", logging into the application.

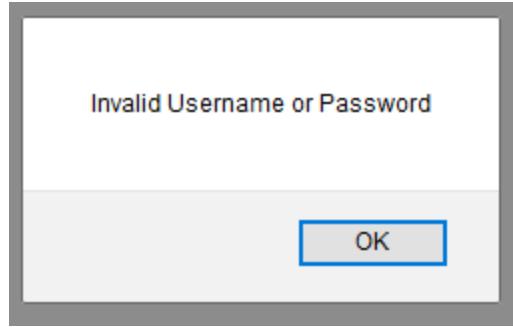

Figure R - Default Login (test@test.com)

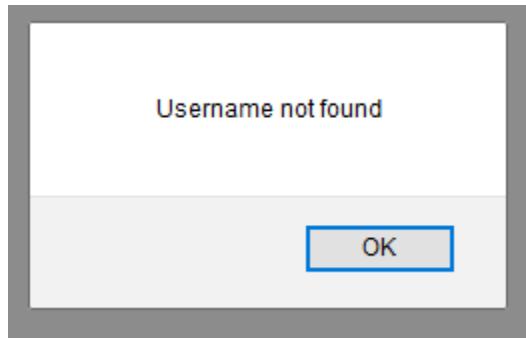

Figure S - Other Default Logins

The next step was testing for default admin credentials, through the admin panel that was found in section 2.3.2. The first test was username “hacklab”, password “hacklab”. Inputting this giving access to the admin page, seen in Figure T.

A screenshot of the application's admin page. The top navigation bar includes the logo "Hacklab Security.", links for CRM, ASSET, ONLINE ORDERING, and Log Out, and a search bar. The main content area has a header "Customer Management". Below it is a "Submit Query" form containing a message: "We will never give you up" (Date: July 1, 2017 - 08:07 AM) and "We will certainly not give you up...". A "Read More" button is present. To the right is a sidebar with links: Home (selected), Customers (with a user icon), Customer List (with a user icon), Announcement, and Messages (with a yellow envelope icon). The footer contains the copyright notice "© Hacklab Security 2020".

Figure T - Admin Page

### 2.5.3 Testing for Weak lock out mechanism

The application lacks a lockout mechanism, allowing it to be vulnerable to brute force attacks. This was tested by entering wrong credentials multiple times, with no repercussions.

#### 2.5.4 Testing for Bypassing Authentication Schema

To test for bypassing the authentication on the application, direct page navigation was tested and SQL injection. As found earlier in the testing the admin logon page is <http://192.168.1.20/admin/>. The query ““ OR 1 = 1;--” was inputted in both the username and password field. The response can be viewed in Figure U. This test was also conducted on the user login page, with the same results.

The screenshot shows a dark-themed login interface. At the top, a red error message box contains the text "Please Check Your Username And Password". Below it is a "Username" field with a user icon and a "Password" field with a key and lock icon. At the bottom is a large blue "Sign In" button.

Figure U - SQL injection(admin)

As found in section 2.2.6, the admin pages are directly accessible, with no authentication. By navigating to <http://192.168.1.20/admin/ADMIN/>, as seen in Figure V. It allows for access to the admin panel, where users data can be viewed and changed, placed orders can be viewed, alongside the product catalog.

#### Index of /admin/ADMIN

Name	Last modified	Size	Description
Parent Directory		-	
ADS/	2017-07-13 15:57	-	
AS/	2017-07-13 16:00	-	
QOS/	2017-07-13 16:01	-	
SERVER/	2017-07-08 20:53	-	

Figure V - Index of Admin

#### 2.5.5 Testing for Vulnerable Remember passwords

A lot of browsers offer the ability to remember passwords, for the convenience of the user. However, this can make it easier for an attacker to access this information if they get access to the users browser, though physical means or through cross site scripting. As seen in Figure W, when the user logs in, the browser (Mozilla Firefox) asks if they want to save the password. Upon next login, the information is prefilled, as seen in Figure X, allowing an attacker to get unauthorized access to the service.

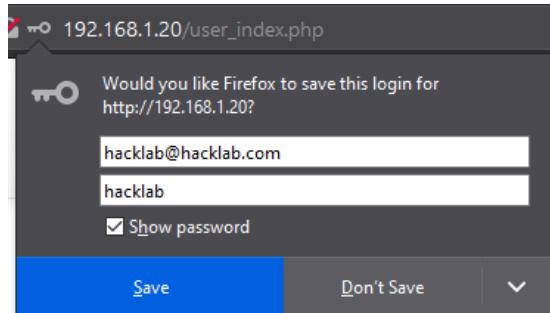

Figure W - Save Login

Figure X - Next Login

## 2.5.6 Testing for Weak Password Policy

As found in section 2.4.2, the policy for passwords within the web application, is that passwords must be between 7-14 characters. Having a max length of password isn't advisable as it means the hashes for the passwords have a maximum length, allowing for them to be cracked easier. There is also no requirement for special characters, numbers or capital letters, allowing the entered passwords to be much simpler and thus, weaker.

## 2.5.7 Testing for Weak password change or reset functionality

To change a user's password, there is a forgot password button within the application. This button links to <http://192.168.1.20/forgotpass.php>, where the user is prompted to enter the email address attached to the account. Once submitted, the password is changed, with the changed password emailed to the user, as seen in Figure Y. At this point the user is locked out of their account. This information required to change the password can be easily come across, through SQL injection or direct page navigation.

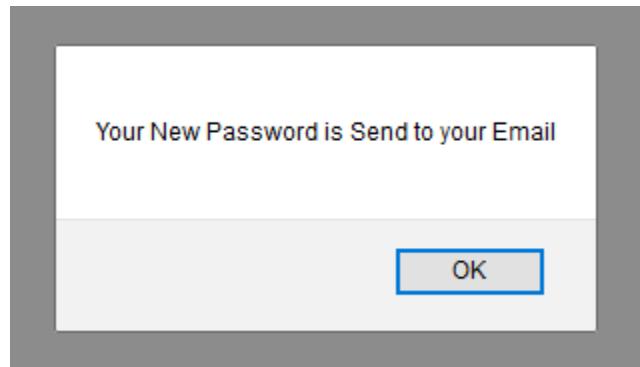

Figure Y - Password Reset

## 2.6 AUTHORIZATION TESTING

---

### 2.6.1 Testing Directory Traversal/File Include

Directory traversal is present within the application and can be seen by navigating to the address, <http://192.168.1.20/admin/ADMIN/>. On this page links to all the admin pages are visible, as seen in Figure Z.

---

## Index of /admin/ADMIN

<u>Name</u>	<u>Last modified</u>	<u>Size</u>	<u>Description</u>
 <a href="#">Parent Directory</a>		-	
 <a href="#">ADS/</a>	2017-07-13 15:57	-	
 <a href="#">AS/</a>	2017-07-13 16:00	-	
 <a href="#">OOS/</a>	2017-07-13 16:01	-	
 <a href="#">SERVER/</a>	2017-07-08 20:53	-	

Figure Z - Admin Directory Traversal

### 2.6.2 Testing for Bypassing Authorization Schema

Bypassing of the authorization schema can be seen in section 2.6.1, as within the parent directory there is a login page. This login page can be bypassed by navigating to <http://192.168.1.20/admin/ADMIN/>, where users can gain unauthorized access.

## 2.7 SESSION MANAGEMENT TESTING

### 2.7.1 Testing for Session Management Schema

Whilst investigating the application, using OWASP Mantra, the cookies for a user's login were captured. This consisted of 2 cookies, "PHPSESSID" and "SecretCookie", see Figure AA. On user login, the values of these cookies were:

PHPSESSID – issia0305i4fn7ocg80jmr9sl0

SecretCookie –

22756e7078796e6f40756e7078796e6f2e70627a223a37303532706e71366f34313573343237327031393  
8366e6e396e35306e3770333a31363037303838393132

Name:	SecretCookie
Content:	22756e7078796e6f40756e7078796e6f2e70627a223a37303532706e71366f343135733432373270313938366e6e396e35306e3770333a31363037303838393132
Host:	192.168.1.20
Path:	/
Send For:	Any type of connection
Expires:	At end of session

Figure AA - SecretCookie

The cookie of interest is the "SecretCookie", as the PHPSESSID is a randomly generated value, this was proven through Burp Sequencer, and can be seen in Figure BB. At this current point the cookie is hashed in some way and cannot be used. Using applications such as CyberChef, the cookie can be decoded into more useful information. In Figure CC, the original value for the cookie can be seen, as well as the decoded value.

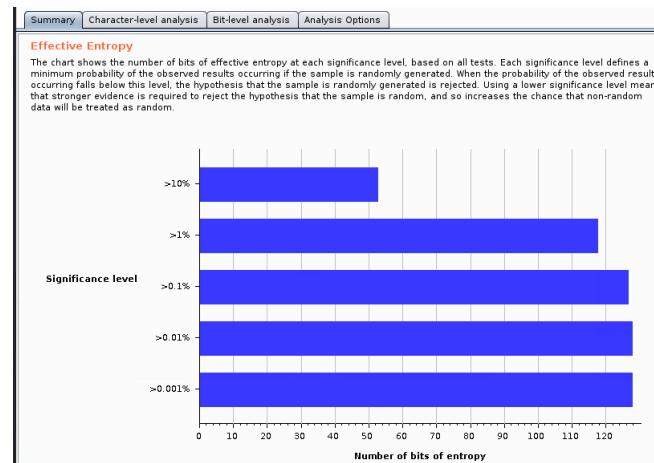

Figure BB - Burp Sequencer

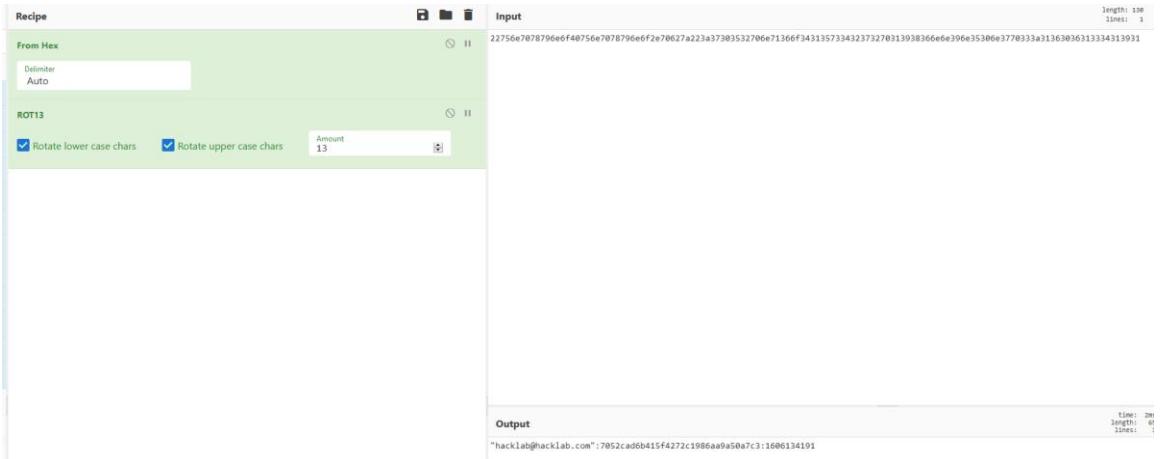

Figure CC – CyberChef

### 2.7.2 Testing for cookies attributes

Through the decoded value of SecretCookie being:

"hacklab@hacklab.com":7052cad6b415f4272c1986aa9a50a7c3:1606134191

It can be seen that the first value is the login of the user, along with 2 other values. The third value is a Unix timestamp, the value of which is the time that the cookie was created, as can be seen in figure DD.

**1606134191**  
 Is equivalent to:  
**11/23/2020 @ 12:23pm (UTC)**  
 2020-11-23T12:23:11+00:00 in ISO 8601  
 Mon, 23 Nov 2020 12:23:11 +0000 in RFC 822, 1036, 1123, 2822  
 Monday, 23-Nov-20 12:23:11 UTC in RFC 2822  
 2020-11-23T12:23:11+00:00 in RFC 3339

Figure DD - Unix Timestamp

The second value of the cookie was put through the online hash cracker, “CrackStation” where the result was “hacklab”, as can be seen in Figure EE.

Enter up to 20 non-salted hashes, one per line:

7052cad6b415f4272c1986aa9a50a7c3

I'm not a robot Privacy - Terms

Crack Hashes

**Supports:** LM, NTLM, md2, md4, md5, md5(md5\_hex), md5-half, sha1, sha224, sha256, sha384, sha512, ripeMD160, whirlpool, MySQL 4.1+ (sha1(shai\_bin)), QubesV3.1BackupDefaults

Hash	Type	Result
7052cad6b415f4272c1986aa9a50a7c3	md5	hacklab

Color Codes: **Green**: Exact match, **Yellow**: Partial match, **Red**: Not found.

Figure EE - CrackStation

This shows that the cookie is organized into 3 parts, these are:

User Name:Password:Unix Timestamp

### 2.7.3 Testing for logout functionality

To test for logout functionality, the account [hacklab@hacklab.com](mailto:hacklab@hacklab.com) was accessed, to firstly create the session for the user. The account was then logged out of, to destroy the session. The captured session IDs from the login were then placed into the web application, to test if the session had been destroyed, as can be seen in Figure FF. The user wasn't logged in, showing that the web application had destroyed the session.

Filter items			
Name	Value	Domain	Path
PHPSESSID	em4o2t8qaohI0fd4eh4q2cv0b1	192.168.1.10	/

...	...	...	...

Figure FF – Logout

## 2.8 INPUT VALIDATION TESTING

### 2.8.1 Testing Directory Traversal/File include

Testing for directory traversal is an essential part of a web application test. If it is present it could lead to unauthorized access to files held within the server. Alongside this it can lead to unauthorized execution of system commands. The OWASP ZAP scan revealed that directory traversal may be possible. To verify this the URL <http://192.168.1.20/appendage.php?type=%2Fetc%2Fpasswd> was navigated to, the results of which can be seen in Figure GG.

```
root:x:0:0:root:/root/bin/bash daemon:x:1:1:daemon:/usr/sbin/daemon bin:x:2:bin:/bin:/usr/sbin/nologin sys:x:3:sys:/dev:/usr/sbin/nologin sync:x:4:65534:sync:/bin:/bin:/sync games:x:5:60:games:/usr/games:/usr/sbin/nologin man:x:6:12:man:/var/cache/man:/usr/sbin/nologin lp:x:7:7:lp:/var/spool/lpd:/usr/sbin/nologin mail:x:8:mail:/var/mail:/usr/sbin/nologin news:x:9:9:news:/var/spool/news:/usr/sbin/nologin uucp:x:10:10:uucp:/var/spool/uucp:/usr/sbin/nologin proxy:x:13:13:proxy:/bin:/usr/sbin/nologin www-data:x:33:33:www-data:/var/www:/usr/sbin/nologin backup:x:34:34:backup:/var/backups:/usr/sbin/nologin list:x:38:38:Mailing List Manager:/var/list:/usr/sbin/nologin irc:x:39:39:ircd:/var/run/ircd:/usr/sbin/nologin gnats:x:41:41:Gnats Bug-Reporting System (admin):/var/lib/gnats:/usr/sbin/nologin nobody:x:65534:65534:nobody:/nonexistent:/usr/sbin/nologin systemd-timesync:x:100:102:systemd Time Synchronization,,,:/run/systemd:/bin/false systemd-network:x:101:103:systemd Network Management,,,:/run/systemd:/netif:/bin/false systemd-resolve:x:102:104:systemd Resolver,,,:/run/systemd/resolve:/bin/false systemd-bus-proxy:x:103:105:systemd Bus Proxy,,,:/run/systemd:/bin/false syslog:x:104:108:/home/syslog:/bin/false _apt:x:105:65534:/:/nonexistent:/bin/false messagebus:x:106:110:/var/run/dbus:/bin/false uuidd:x:107:111:/run/uuidd:/bin/false lightdm:x:108:112:Light Display Manager:/var/lib/lightdm:/bin/false ntp:x:109:114:/home/ntp:/bin/false whoopsie:x:110:115:/:/nonexistent:/bin/false dnsmasq:x:111:65534:dnsmasq,,,:/var/lib/misc:/bin/false pulse:x:112:120:PulseAudio daemon,,,:/var/run/pulse:/bin/false osboxes:x:1000:1000:osboxes.org,,,:/home/osboxes:/bin/bash mysql:x:999:1001:/home/mysql:
```

Figure GG - Path Traversal

### 2.8.2 Testing for Reflected Cross Site Scripting

As discovered previously using OWASP ZAP, as well as other tools, the web application is vulnerable to Cross-Site Scripting. The easiest method to test this is by inputting an alert script, into the web application. Testing revealed that if you input "%22%3Cscript%3Ealert(1);%3C/script%3E%0A" into a URL where an ID variable present, the script will be reflected, as can be seen in Figure HH.

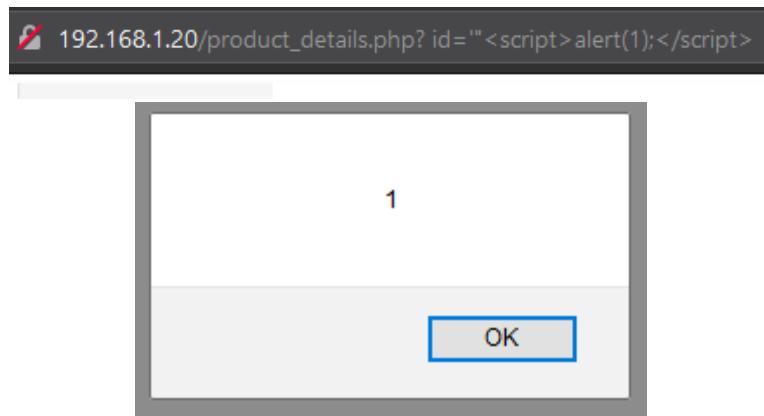

Figure HH - Reflected XSS

As well as inputting Cross-Site Scripting into the URL, it was also tested on all other input boxes on the web application. All other tests came back negative apart from the registration/account information page. As can be seen in Figure II, the form was filled in with alerts. The results for which can be seen in Figure JJ.

The screenshot shows a web page titled "Your personal information". It contains the following fields:

- Gender: Male
- First name: <script>alert(1);</script>
- Middle name: <script>alert(2);</script>
- Last name: <script>alert(3);</script>
- Date of Birth: 15 / 09 / 1995
- Address: <script>alert(4);</script>
- City: <script>alert(5);</script>
- Contact Number: 012345678
- Email: hacklab@hacklab.com
- New Password: [redacted]

At the bottom, there is a "Save" button and a link "Click here to change profile picture".

Figure II - Account Information XSS

Figure JJ - Account Information Results

As can be seen above the fields First Name and Last name reflect Cross-Site Scripting.

### 2.8.3 Testing for Stored Cross Site Scripting

Unlike reflected Cross-Site Scripting, stored Cross-Site Scripting is imbedded into the webpage. To test for this BeEF was used. The script that was injected can be seen in Figure KK.

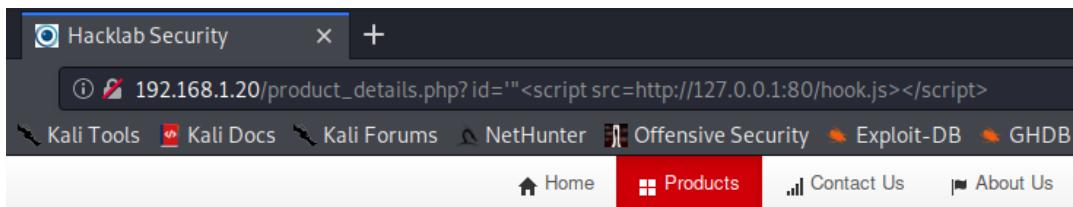

Figure KK - BeEF Injection

This then injected the file "hook.js" into the webpage. Anyone who navigates to the page "product\_details.php" will "hooked" by hook.js, as can be seen in Figure LL. In this example the hooked browser is on a Kali Linux Virtual Machine.

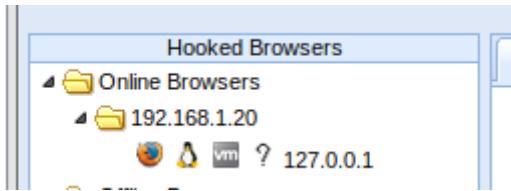

Figure LL - BeEF Hooked

From this point the BeEF framework can distribute multiple different attacks and exploits. In the example a prompt is sent to the user to enter a username and password, for the example the details inputted were proof:proof, and the results can be viewed within the BeEF framework. This can be seen in Figure MM.

Module Results History		
id	date	label
0	2020-11-23 07:19	command 1

Command results  
1 data: answer=proof:prrof

Figure MM - BeEF Results

#### 2.8.4 Testing for SQL Injection

Through the testing of the web application, it has revealed that the application is vulnerable to SQL injection. This is the input of SQL code, with the goal of the web application executing it, possibly dumping sensitive information about the application. To test for this, SQL Map was used to dump the database. The query ran was “sqlmap -u “http://192.168.1.20/user\_product\_details.php?id=1” -D aa2000 --dump”. This command dumped the entire database as CSV files, these can be found in Appendix G. Along with this dumping of the database, a few other tables of interest were determined, these are tb\_user and user\_type. The information of which can be seen in Figure NN.

Database: aa2000				
Table: tb_user				
[3 entries]				
userID	utype	Employee	password	username
1	3	Benjie I. Alfanta	e10adc3949ba59abbe56e057f20f883e (123456)	BENJIE_00S
2	2	Leo Aranzamendez	7052cad6b415f4272c1986aa9a50a7c3 (hacklab)	hacklab
3	1	Julius Felicen	cad244dfa5414a55acc94545ebd09416 (zimmerman)	admin

typeID	user_type
1	ADVERTISING Admin
2	ASSET Admin
3	ONLINE ORDERING Admin
4	SUPER Admin

*Figure NN - SQL injection*

As can be seen in Figure MM, account information along with unencrypted passwords can be retrieved through SQL injection.

## 2.9 ERROR HANDLING

---

### 2.9.1 Analysis of Error codes

Testing was conducted to determine how the web application responded to incorrect information. To do this the wrong URLs were deliberately inputted, these URLs are:

- /product.php
- /contact.php

Both URLs returned the same error message, this can be seen in Figure OO.

#### **Object not found!**

The requested URL was not found on this server. If you entered the URL manually please check your spelling and try again.

If you think this is a server error, please contact the [webmaster](#).

#### **Error 404**

*192.168.1.10  
Apache/2.4.29 (Unix) OpenSSL/1.0.2n PHP/5.6.34 mod\_perl/2.0.8-dev Perl/v5.16.3*

Figure OO -Error codes

Alongside this testing, tests were also conducted to determine how the web application reacts to incorrect login information. The tests conducted were as follows:

- [-hacklab@hacklab.com:a](#) (Seen in Figure PP)
- [-hack@hack.com:hacklab](#) (Seen in Figure QQ)

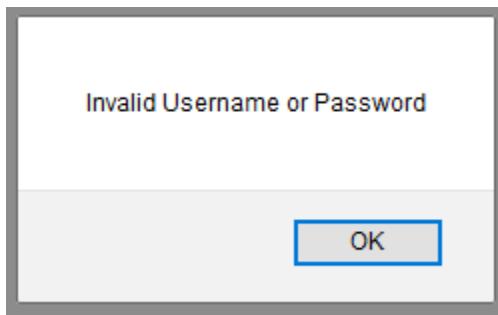

Figure PP - Correct Username, Wrong Password

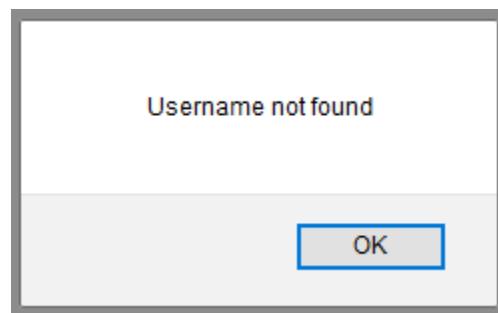

Figure QQ - Incorrect Username

## **2.10 CRYPTOGRAPHY**

---

### **2.10.1 Weak SSL/TLS Ciphers**

To test for weak SSL/TLS Ciphers, sslyze was used. The command “sslyze –regular 192.168.1.20” was ran, this returned a large amount of information about the ciphers present within the web application, these can be found in Appendix H.

## 2.11 BUSINESS RULES

---

### 2.11.1 Test Ability to forge requests

As demonstrated earlier in the penetration test, the application is vulnerable to attacks such as SQL injection, Cross-Site scripting, along with many other vulnerabilities. The application is vulnerable to unauthorized access to the admin pages, through misconfiguration of session and forced page traversal, this has been demonstrated earlier within the report.

### 2.11.2 Test number of times a function can be used limits

As demonstrated earlier within the report, the application contains no lockout against a brute force attack. This lack of security could allow an attacked access, given enough time, as there is no limit to how many times, they input the wrong data.

### 2.11.3 Test Upload of Unexpected File Types

To test how the web application responds to the upload of unexpected file types, a text file was created. The text file was renamed to Shell.jpg, the contents of which can be found in Appendix I, this file was then uploaded as the user's profile picture. The results of which can be seen in Figure RR.

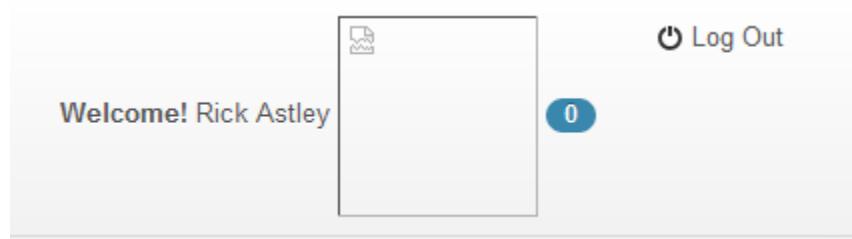

Figure RR - Unexpected Files

To further this testing, another test was conducted using a PHP file, called Shell.php. The contents of the file can be found in Appendix I. The results for this test can be seen in Figure SS.

Figure SS - Shell.php

A final test was conducted to determine if the application checked the internal content of the file or just the file extension. To test this the file Shell.php was renamed to ShellPhp.jpg. The results for this can be seen in Figure TT. As the results show, the web application only checks the file extension, and not the contents of the file.

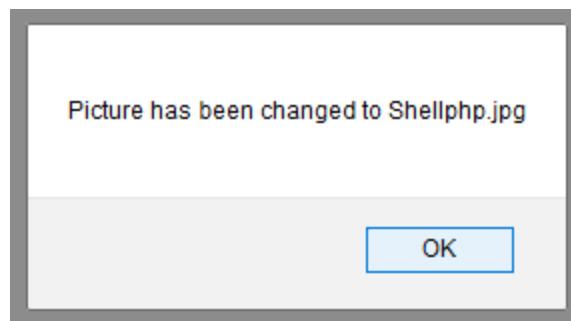

Figure TT - Shellphp.jpg

## 2.12 CLIENT SIDE TESTING

---

### 2.12.1 Testing for JavaScript Execution

To test if JavaScript injection is present within the web application, Burp Suite proxy was used. The test conducted was the process of adding an item to the user's cart and changing the price of the item. As can be seen in Figure UU, the price variable can be seen within Burp Suite.

```
3 Cookie: SecretCookie=
22756e7078796e6f40756e7078796e6f2e7062'
1677t5bt5r0tcveuda33ed6cq0
4 Connection: close
5
5 id=5&price=600&quantity=1&submit=
```

Figure UU - Burp Suite Product Price

This price variable can be edited, for the purpose of the testing it was set to 6, and carries on throughout the purchase process, allowing the user to purchase items for vastly reduced costs. As can be seen in Figure VV, the injected price carries over to the checkout page.

Quantity/Update	Price	Total	Action
1	600.00	6.00	<input type="button" value="X"/> <input type="button" value=""/>
<b>TOTAL= £6</b>			

Figure VV – Checkout

## **2.13 OMITTED METHODOLOGY**

---

As mentioned throughout the report, certain parts of the OWASP Web Application Penetration Testing methodology have been omitted. This is due to the OWASP methodology being capable of covering all possible web application penetration testing possibility, and as such not all categories are relevant for this penetration test. This is due to the section of testing either being out of scope or testing that has been conducted through other sections.

### **Information Gathering**

- Conduct Search Engine Discovery and Reconnaissance for Information Leakage
- Map Application Architecture

### **Configuration and Deployment management Testing**

- Test Network/Infrastructure Configuration
- Backup and Unreferenced Files for Sensitive Information
- Enumerate Infrastructure and Application Admin Interfaces
- Test HTTP Methods
- Test RIA cross domain policy

### **Identity Management Testing**

- Test Account Provisioning Process
- Testing for Account Enumeration and Guessable User Account
- Testing for Weak or unenforced username policy
- Test Permissions of Guest/Training Accounts
- Test Account Suspension/Resumption Process

### **Authentication Testing**

- Testing for Browser cache weakness
- Testing for Weak security question/answer
- Testing for Weaker authentication in alternative channel

### **Authorization Testing**

- Testing for Insecure Direct Object References

### **Session Management Testing**

- Testing for Session Fixation
- Testing for Exposed Session Variables
- Testing for Cross Site Request Forgery
- Test Session Timeout
- Testing for Session puzzling

### **Input Validation Testing**

- Testing for HTTP Verb Tampering
- Testing for HTTP Parameter pollution
- Testing for LDAP Injection
- Testing for ORM Injection
- Testing for XML Injection

- Testing for SSI Injection
- Testing for XPath Injection
- IMAP/SMTP Injection
- Testing for Code Injection
- Testing for Command Injection
- Testing for Buffer overflow
- Testing for incubated vulnerabilities
- Testing for HTTP Splitting/Smuggling

#### **Error Handling**

- Analysis of Stack Traces

#### **Cryptography**

- Testing for Padding Oracle
- Testing for Sensitive information sent via unencrypted channels

#### **Business Logic Testing**

- Test Business Logic Data Validation
- Test Integrity Checks
- Test for Process Timing
- Testing for the Circumvention of Work Flows
- Test Defenses Against Application Mis-use
- Test Upload of Malicious Files

#### **Client Side Testing**

- Testing for DOM based Cross Site Scripting
- Testing for HTML Injection
- Testing for Client Side URL Redirect
- Testing for CSS Injection
- Testing for Client Side Resource Manipulation
- Test Cross Origin Resource Sharing
- Testing for Cross Site Flashing
- Testing for Clickjacking
- Testing WebSockets
- Test Web Messaging
- Test Local Storage

## 3 DISCUSSION

### 3.1 SOURCE-CODE ANALYSIS

In order to analyze the source code of the web application, the OWASP Static Code Analysis Methodology was used (Static Code Analysis Control | OWASP Foundation, 2021). This was selected for consistency due to the use of the OWASP Web Application Penetration Testing Methodology.

#### 3.1.1 Strengths and Weaknesses

There are multiple benefits to automating source code analysis, however, there are also downsides to automating the analysis. These are as follows;

##### Strengths

- Scalability: Using automated tools for source code analysis allows for large projects to be analyzed.
- Speed: As analysis is automated the speed at which a computer can go through large quantities of source code is vastly superior to that of a human.
- Common vulnerabilities are easily found.

##### Weaknesses

- A high percentage of false positives.
- Possible configuration errors within the analysis tool.
- Complex vulnerabilities are more difficult to detect through automated analysis.
- Difficult to analyze the code if it is not capable of compiling.

Through considering the strengths and weaknesses of automating the source code analysis, it was concluded that a manual analysis would be conducted.

### 3.2 RESULTS OF ANALYSIS

#### 3.2.1 Hidden.php

Within the directory for the web application, a file called “hidden.php” can be seen. The contents of this file can be seen in Figure WW. The presence of this file within the application is a massive security risk, as, if uncovered by a remote attacker, then they could gain physical access to the building.

```
1 <!-- ***Note to self: Door entry number is 1846 -->
2
```

Figure WW - hidden.php

### 3.2.2 Cookie Encoding

Within the application the cookies for sessions are created through a predefined function, more detail on this can be found in Section 3.3.4.

## 3.3 VULNERABILITIES AND MITIGATION

---

### 3.3.1 Robots.txt

#### 3.3.1.1 Vulnerability

Within the robots.txt, as seen in Section 2.2.2 - Review Webserver Metafiles, a file called “company-accounts” be found. The contents of this file can be seen in Appendix B. The information found within the file could be used to further an attack on the web application.

The robots.txt file does have many legitimate uses, for example, search engine optimization. This can be done by allowing and disallowing certain web crawlers access to certain parts within the web application (Robots.txt File [2021 Examples], 2021). However, it shouldn’t be used to hide sensitive information, as users can still access the information by directly navigating to the URL.

#### 3.3.1.2 Mitigation

Several possible mitigations exist for this vulnerability. The easiest to implement would be to remove the “company-accounts” folder, from the robots.txt file. This mitigates the possibility of a user coming across the file and possibly gaining access to sensitive information.

Another form of mitigation to the threat would be using the robots.txt file to create a honeypot. The honeypot could then be used to blacklist IP addresses that attempted to access it. To implement this, an additional page could be created, for example “/adminpage.php”. This page would then track IPs that accessed it and add them to a blacklist. This page is then added to the robots.txt file.

### 3.3.2 Local File Inclusion

#### 3.3.2.1 Vulnerability

As found in Section 2.8.1 - Testing Directory Traversal/File include, a Local File Inclusion vulnerability (LFI) is present within the page “appendage.php”. This vulnerability exists when a user can input a value that displays a file within the server. This vulnerability is like Remote File Inclusion (RFI); however, it displays local files instead of remote files (What Is Local File Inclusion (LFI)? - DZone Security, 2021).

#### 3.3.2.2 Mitigation

Mitigation already exists for an LFI vulnerability, however, this is unsuitable, as it is possible to input a value capable of bypassing it. The mitigation is as follows;

```
$pagetype = str_replace( array( "../", ".." ), "", $pagetype);
```

This mitigation will block strings such as “..” and “..”, commonly used to access the Linux file system. However, it can be obfuscated, and bypassed with strings such as “....//”. A better implementation of mitigation would be to check characters instead of string values or to create an approved list of characters.

This would remove the ability to bypass the verification. However ultimately, the best mitigation would be to, if possible, remove the dynamically included files, or create a whitelist of accessible files.

### 3.3.3 Hidden source code

#### 3.3.3.1 Vulnerability

Within the comments of the “user\_order.php” page, a comment of “\*\*\* info.php is here”. It is of utmost importance that the source code for a web application is secure. Once navigated to, the info.php contains the infrastructure that the web application is running on, this, in turn, undermines the security of the application, as attackers now know the exact services that are running.

#### 3.3.3.2 Mitigation

To ensure this vulnerabilities removal from the web application, the source code should be reviewed by multiple parties, before an update is released. This should include both internal and external bodies, as well as independent parties. This is essential, not just for the current version of the application but for any future versions of the application to be released.

### 3.3.4 Reversible cookie

#### 3.3.4.1 Vulnerability

As seen in Section 2.7 – Session Management Testing, the cookies issued from the web application were able to be decoded. This vulnerability can then allow an attacker to hijack a session belonging to an authorized user.

The cookie used for the investigation, and subsequent decoding was;  
SecretCookie=22756e7078796e6f40756e7078796e6f2e70627a223a37303532706e71366f34313573343  
2373270313938366e6e396e35306e3770333a31363037303838393132

As discovered in Section 2.7.1 – Testing for Cookie Attributes, the encryption of the SecretCookie is (Hex(Rot13(String))). This allows for easy decryption through tools such as CyberChef. These results can be seen in Section 2.7.

#### 3.3.4.2 Mitigation

There are many ways to possibly decode a session cookie. Possible mitigations for this vulnerability would be to keep the sessions within the server and prevent caching. This can be done by adding the httpOnly (HttpOnly - Set-Cookie HTTP response header | OWASP, 2021) flag, within the Set-Cookie section of the HTTP header. This flag, if the browser supports it, will not allow the cookie to be accessed through a client-side script, such as JavaScript.

### 3.3.5 Cookie attributes

#### 3.3.5.1 Vulnerability

Ideally, a cookie from a web application would contain multiple flags such as;

- Secure
- httpOnly
- Cookie Expiry
- Cookie Scope

Cookies are essential within modern web applications and a lot of functionality attached to them. If they aren't secure it can then lead to an attacker gaining access to a user's account or admin pages. It is critical within modern web applications that the cookies and sessions are kept secure.

### **3.3.5.2 Mitigation**

Mitigation for this vulnerability is the implementation and configuration of the flags previously mentioned.

Secure – ensures that the cookie is only transported over encrypted connections, for example, TLS connections.

httpOnly – Allows only the server to access the cookie and not client-side scripts, like JavaScript.

Cookie Expiry – Sets the amount of time the cookie will last before it expires. This will lead to better security as cookies will continue to be created as they expire.

Cookie Scope – Sets what domains and directories a cookie is valid for (Using HTTP cookies - HTTP | MDN, 2021).

## **3.3.6 Directory browsing**

### **3.3.6.1 Vulnerability**

Directory browsing is a dangerous vulnerability within web applications, due to the possible disclosure of sensitive information. It allows for server directories to be viewed and downloaded within the browser, allowing for the revelation of sensitive information.

### **3.3.6.2 Mitigation**

The mitigation for this vulnerability is to amend the configuration files within the apache server. By adding;

```
<Directory "/">
    Require all denied
</Directory>
```

This configuration blocks access to the defined directory (Security Tips - Apache HTTP Server Version 2.4, 2021). The best practice for web servers is to only allow access to the directory of the web application.

## **3.3.7 User enumeration**

### **3.3.7.1 Vulnerability**

As demonstrated in Section 2.9 – Analysis of Error Codes, it was discovered that user enumeration was possible. This was done through the error codes that were presented with attempted login attempts. Through this, it is possible to enumerate if an account with a username exists or not.

### **3.3.7.2 *Mitigation***

There are multiple possible mitigations for this vulnerability. The simplest is to make the error messages more consistent. To implement this, change the error messages to the same message, be it incorrect username/password or if the user account doesn't exist. This change will take away the possibility to enumerate user accounts through the presented error codes.

## **3.3.8 Unlimited login attempts**

### **3.3.8.1 *Vulnerability***

As mentioned in Section 2.5.3 - Testing for Weak lockout mechanism, there is no lockout mechanism within the web application. This was proven by entering incorrect credentials into both the login and admin login panels. This leaves the application vulnerable to brute force attacks.

### **3.3.8.2 *Mitigation***

There are multiple ways to mitigate the threat of brute force attacks such as the use of CAPTCHAs, a delay on password authentication, and a lockout for accounts after a certain amount of login attempts. CAPTCHAs require user interaction and by implementing them into the login system, it then forces users' interactions before the login attempt is sent to the server. Alongside this a random delay in users' login requests will be an unnoticeable change for legitimate users, however, for brute force attack, it could add a significant amount of time onto the attack, helping mitigate the risk (Blocking Brute Force Attacks Control | OWASP Foundation, 2021).

## **3.3.9 No HTTPS**

### **3.3.9.1 *Vulnerability***

As mentioned in Section 2.5.1 Testing for Credentials Transported over an Encrypted Channel, the traffic for the web application is using HTTP, instead of HTTPS. This use of HTTP is an inherent weakness within the application as there is no encryption within HTTP, unlike HTTPS which uses SSL encryption while transporting data.

### **3.3.9.2 *Mitigation***

The mitigation for this flaw is to generate an SSL certificate and to change the configuration within the apache server to force the use of HTTPS. The generation of an SSL cert can be done within the web application server (IBM Knowledge Center, 2021). Alongside this, the configuration of the Apache server needs to be changed to force the use of HTTPS (Apache Redirect to HTTPS - SSL Certificates - Namecheap.com, 2021).

### 3.3.10 File upload

#### 3.3.10.1 Vulnerability

As demonstrated in Section 2.11.3 - Test Upload of Unexpected File Types, the web application only checks the file extension when checking the upload. This vulnerability is present within the account section of the webpage, and the function is designed to allow users to change their profile pictures.

#### 3.3.10.2 Mitigation

The mitigation for this vulnerability would be to implement a system to either verify the file contents or scan the file for malicious code. This can be done in multiple ways such as using an anti-virus within the web application, for example, "VirusTotal". This can be used to scan incoming files for malicious content.

To verify the file types, a subfunction could be created within the upload function, to inspect the files' "magic numbers" (Lavin, 2021). This can be done within PHP and inspects the signature of the file to ensure the file type is correct.

### 3.3.11 Cross-Site Request Forgery (CSRF)

#### 3.3.11.1 Vulnerability

A CSRF is present within the update password function on the web application. This attack could prevent the user from having access to their account.

The vulnerability, as mentioned in Section 2.5.7 - Testing for Weak password change or reset functionality, is present when the user wants to change their password. Instead of the user changing their password, to something that they define, the password is just emailed to the users' account. If this is done maliciously, the user could potentially lose access to their account.

#### 3.3.11.2 Mitigation

There are multiple possible ways to fix this vulnerability. These fixes include change business rules, to implementing a token-based system for password changes. Either synchronizer tokens or encrypted/hash basted keys could be used to achieve this. This change would be similar to session cookies; however, they would be dynamically generated, mitigating the threat of attackers tricking users into changing their passwords and subsequently losing access to their account.

Another form of mitigation that can be implemented, is to change the business rule for updating passwords. Instead of an email being sent to update the password automatically, the email would contain a link to a page where the user could update their password. To do this, the user would then enter the password they wanted to change to.

### **3.3.12 Php information disclosure**

#### **3.3.12.1 Vulnerability**

As discovered within Section 2.3.2 - Test File Extensions Handling for Sensitive Information, the “phpinfo.php” is present and accessible within the web application. This gives a possible attacker too much information about the services running the web application.

#### **3.3.12.2 Mitigation**

The easiest mitigation to this vulnerability would be to remove the phpinfo.php file from the root directory. If removal isn’t possible, the file could be moved to a password-protected section of the application, such as within the admin section, or the file permissions could be changed so the file cannot be read. As well as these fixes, the file could be encrypted so that it would be inaccessible to unauthorized parties.

### **3.3.13 SQL Injection**

#### **3.3.13.1 Vulnerability**

The vulnerability for SQL injection exists within the login function. This vulnerability allows for the user to input SQL code. The web application then executes the SQL code, possibly disclosing sensitive information about the users of the web application. Mitigation for this vulnerability exists within the web application, however, it is unsuitable and easily bypassed. The existing mitigation is;

```
$username= str_replace(array("1=1", "2=2", "select","Select","3=3","2 =2","'a='a'"), "", $username);
```

#### **3.3.13.2 Mitigation**

The current mitigation only applies if the value within the array exists within the injected string. However, there are more efficient ways of doing this. For example, using the “htmlspecialchars()” function within PHP. This function converts characters to HTML entities (PHP: htmlspecialchars - Manual, 2021), vastly limiting the possibility of SQL injection. Alongside, the implementation of the “htmlspecialchars()”, the method for acting on the users’ input could be written more securely (PHP: SQL Injection - Manual, 2021).

### **3.3.14 Hidden guessable folder**

#### **3.3.14.1 Vulnerability**

A folder is hidden within the web application, this folder contains a file called “sqlcm.bak”, which contains a backup of the SQL injection countermeasures. The information of the SQL injection countermeasures is incredibly sensitive, within the context of web application security. If an attacker gained access to the file, then the SQL injection countermeasures could be bypassed easily.

#### **3.3.14.2 Mitigation**

Mitigation to this vulnerability could be implemented in multiple ways, for example moving the file into a directory that is inaccessible to standard users, for example, the admin section of the application. Another form of mitigation would be to encrypt the file, this would require some method of decryption for the file to be accessed.

### 3.3.15 Brute-forceable Admin

#### 3.3.15.1 Vulnerability

The username for the admin account is “admin”, as mentioned in section 2.8.4- Testing for SQL Injection. Alongside this, the password is “Zimmerman” which was able to be brute-forced within the investigation. This is a critical flaw in the security of the web application as if an attacker gains access to the admin section of the application, the attacker can gain full control of the web application.

#### 3.3.15.2 Mitigation

The mitigation for this vulnerability would be to either change the password for the “admin” account or have a lockout mechanism.

The “admin” account password should be changed to something more secure. Using NCSCs guidance, the password should be made up of 3 random unrelated words. (Three random words or #thinkrandom, 2021) By changing the password in alignment with the NCSC guidance, brute force attacks would be massively mitigated

Alongside changing the password to the account, a lockout mechanism can be added to the admin login page. This would lock a user out after a defined amount of failed login attempts, mitigating the risk of brute force attacks.

### 3.3.16 Other Vulnerabilities

Alongside the vulnerabilities previously mentioned, multiple other smaller vulnerabilities exist within the web application. These range from the lack of headers within the web application, to having CVEs present within the application. The list of vulnerabilities are as follows:

x-powered-by header – This header reveals what version of PHP is running within the application. This can be used to find an exploit specific to the PHP version. The mitigation for this vulnerability would be to remove the header from the application.

X-Frame-Options header is not present – This header defines whether a browser should be allowed to render a page within a frame. Its lack of presence can allow for the click-jacking attack. To mitigate the risk for this vulnerability, the addition of the X-Frame-Options header, along with suitable flags (OWASP Secure Headers Project, 2021)

X-XSS-Protection header is not defined – The lack of this header leaves the web application more vulnerable to cross-site scripting attacks. The addition of this header along with suitable flags((OWASP Secure Headers Project, 2021), would mitigate the risk.

X-Content-Type-Options header is not set – The lack of this header could allow for a MIME sniffing attack. This attack allows for a malicious party to utilize unauthorized scripts within the webpage (OWASP Secure Headers Project, 2021).

GET Apache mod\_negotiation – Having this enabled with MultiViews, allows for an attacker to brute force file names within directories, through carefully crafted HTTP headers (Wisec - The Wise SEcurity, 2021).

OSVDB-112004 – Through using the /cgi-bin/printenv, the site appears to be vulnerable to the ShellShock vulnerability. This vulnerability is present within the bash scripting language and allows for remote code executing (NVD - CVE-2014-6271, 2021). This vulnerability can be mitigated by updating the bash language within the hardware the server is running on, by issuing this command;

Sudo apt-get update && sudo apt-get install –only-upgrade bash.

TRACE HTTP TRACE method – This method being active within the web application can allow the application to be vulnerable to an XST (Cross-Site Tracing) attack. An attacker using the trace or trace methods can send a request to the webserver and possibly access a user's session cookies, leading to session hijacking (Cross-Site Tracing Software Attack | OWASP Foundation, 2021).

PhpMyAdmin – The login page to PhpMyAdmin is accessible to the wider world. This can lead to brute force attacks, or even guessing the credentials. This can allow an attacker access to the MySQL database administration. To mitigate this vulnerability, hide the PHP my admin page being a password protected page, such as admin, or remove access to the page.

### **3.4 GENERAL DISCUSSION**

---

Multiple vulnerabilities have been found within the web application throughout the investigation, leaving insure to attacks. Through using the OWASP Web Application Penetration Testing Methodology, these vulnerabilities were discovered using various tools and techniques. Many of these vulnerabilities are due to weak or no security that can be easily bypassed, as well as not sanitizing users' input to the application.

This report outlines the vulnerabilities, misconfigurations, and security concerns discovered throughout the investigation, including recommended changes. The contents of the report should be used to mitigate the vulnerabilities present within the web application.

## 4 FUTURE WORK

All work conducted during the web application penetration test was documented within the content of this report, for the client to reference and make improvements in the future. Future work could be conducted after adequate time to implement fixes has passed. This would allow the ability to test the security and competency of the fixes implemented.

A second investigation could be done against the web applications server. This would allow for the testing of the machine that the web application is running on, furthering the security of the web application.

Finally, another possible section of future work would be to test the employees of Hacklab Security. This can be done by running a phishing campaign against the company, alongside the use of social engineering techniques. These techniques could include impersonating a contractor or tailgating an authorized user into a restricted area.

## APPENDIX B

### Account Statement.csv

#### Account Statement

To:  
**Bon app'**  
 12, rue des Bouchers  
 Marseille, France  
 13008

Below is a current statement of your account. The total amount due is £1,885.36 and is payable upon the indicated due date. If your payment is in the mail, thank you and please disregard this notice.

If you should have any **questions** please call us at:  
 Phone: (86)-10-61234567  
 Fax: (86)-10-61234568

Sincerely,  
 Tom  
 CEO, XYZ Limited Co.

#### Statement of Account

Invoice Date	Invoice #	Order #	Due Date	Amount	Freight
11/04/1995	10470	10470	11/05/1995	\$1,820.80	\$64.56
			Total:	\$1,885.36	

Remit Payment to:  
 XYZ Limited Co.  
 XYZ Building No.88 AAA Street BBB District  
 Beijing China, 100123

#### Account Statement

To:  
**B's Beverages**  
 Fauntleroy Circus  
 London, UK  
 EC2N 9NT

Below is a current statement of your account. The total amount due is £1,766.57 and is payable upon the indicated due date. If your payment is in the mail, thank you and please disregard this notice.

If you should have any **questions** please call us at:

Home Phone	(206) 555-1189
Extension	2344
Home Address	4726 - 11th Ave. N.E. Seattle, USA, 98105

#### Notes

Laura received a BA in psychology from the University of Washington. She has also completed a course in business French. She reads and writes French.

### Davolio, Nancy

Name	Nancy Davolio
Title	Sales Representative
Birth Date	08/12/1948
Hire Date	01/05/1992
Home Phone	(206) 555-9857
Extension	5467
Home Address	507 - 20th Ave. E. Apt. 2A Seattle, USA, 98122

#### Notes

Education includes a BA in psychology from Colorado State University in 1970. She also completed "The Art of the Cold Call." Nancy is a member of Toastmasters International.

**Dodsworth,Anne**

Name	Anne Dodsworth
Title	Sales Representative
Birth Date	27/01/1966
Hire Date	15/11/1994
Home Phone	(71) 555-4444
Extension	452
Home Address	7 Houndstooth Rd. London, UK, WG2 7LT

**Notes**

Anne has a BA degree in English from St. Lawrence College. She is fluent in French and German.

**Fuller,Andrew**

Name	Andrew Fuller
Title	Vice President, Sales
Birth Date	19/02/1952
Hire Date	14/08/1992
Home Phone	(206) 555-9482
Extension	3457
Home Address	908 W. Capital Way Tacoma, USA, 98401

**Notes**

Andrew received his BTS commercial in 1974 and a Ph.D. in international marketing from the University of Dallas in 1981. He is fluent in French and Italian and reads German. He joined the company as a sales representative, was promoted to sales manager in January 1992 and to vice president of sales in March 1993. Andrew is a member of the Sales Management Roundtable, the Seattle Chamber of Commerce, and the Pacific Rim Importers Association.

**King,Robert**

Name	Robert King
Title	Sales Representative
Birth Date	29/05/1960
Hire Date	02/01/1994
Home Phone	(71) 555-5598
Extension	465
Home Address	Edgeham Hollow Winchester Way London, UK, RG1 9SP

**Notes**

Robert King served in the Peace Corps and traveled extensively before completing his degree in English at the University of Michigan in 1992, the year he joined the company. After completing a course entitled "Selling in Europe," he was transferred to the London office in March 1993.

**Leverling,Janet**

Name	Janet Leverling
Title	Sales Representative
Birth Date	30/08/1963
Hire Date	01/04/1992
Home Phone	(206) 555-3412
Extension	3355
Home Address	722 Moss Bay Blvd. Kirkland, USA, 98033

**Notes**

Janet has a BS degree in chemistry from Boston College (1984). She has also completed a certificate program in food retailing management. Janet was hired as a sales associate in 1991 and promoted to sales representative in February 1992.

**Peacock,Margaret**

Name	Margaret Peacock
Title	Sales Representative
Birth Date	19/09/1937
Hire Date	03/05/1993
Home Phone	(206) 555-8122
Extension	5176
Home Address	4110 Old Redmond Rd. Redmond, USA, 98052

**Notes**

Margaret holds a BA in English literature from Concordia College (1958) and an MA from the American Institute of Culinary Arts (1966). She was assigned to the London office temporarily from July through November 1992.

**Suyama,Michael**

Name	Michael Suyama
Title	Sales Representative

## APPENDIX E

---

```
- Nikto v2.1.6/2.1.5  
+ Target Host: 192.168.1.20  
+ Target Port: 80  
+ GET Retrieved x-powered-by header: PHP/5.6.34  
+ GET The anti-clickjacking X-Frame-Options header is not present.  
+ GET The X-XSS-Protection header is not defined. This header can hint to the user agent to protect  
against some forms of XSS  
+ GET The X-Content-Type-Options header is not set. This could allow the user agent to render the  
content of the site in a different fashion to the MIME type  
+ OSVDB-3268: GET /company-accounts/: Directory indexing found.  
+ GET Entry '/company-accounts/' in robots.txt returned a non-forbidden or redirect HTTP code (200)  
+ GET "robots.txt" contains 1 entry which should be manually viewed.  
+ GET Apache mod_negotiation is enabled with MultiViews, which allows attackers to easily brute force  
file names. See http://www.wisec.it/sectou.php?id=4698ebdc59d15. The following alternatives for  
'index' were found: HTTP_NOT_FOUND.html.var, HTTP_NOT_FOUND.html.var,  
HTTP_NOT_FOUND.html.var, HTTP_NOT_FOUND.html.var, HTTP_NOT_FOUND.html.var,  
HTTP_NOT_FOUND.html.var  
+ HEAD PHP/5.6.34 appears to be outdated (current is at least 7.2.12). PHP 5.6.33, 7.0.27, 7.1.13, 7.2.1  
may also current release for each branch.  
+ HEAD Apache/2.4.29 appears to be outdated (current is at least Apache/2.4.37). Apache 2.2.34 is the  
EOL for the 2.x branch.
```

+ HEAD OpenSSL/1.0.2n appears to be outdated (current is at least 1.1.1). OpenSSL 1.0.0o and 0.9.8zc are also current.

+ HEAD Perl/v5.16.3 appears to be outdated (current is at least v5.20.0)

+ BLDHSTPB Web Server returns a valid response with junk HTTP methods, this may cause false positives.

+ OSVDB-877: TRACE HTTP TRACE method is active, suggesting the host is vulnerable to XST

+ GET Cookie PHPSESSID created without the httponly flag

+ GET /admin/config.php: PHP Config file may contain database IDs and passwords.

+ GET /phpinfo.php: Output from the phpinfo() function was found.

+ GET /config.php: PHP Config file may contain database IDs and passwords.

+ OSVDB-3092: GET /admin/: This might be interesting...

+ OSVDB-3268: GET /backup/: Directory indexing found.

+ OSVDB-3092: GET /backup/: This might be interesting...

+ OSVDB-3268: GET /css/: Directory indexing found.

+ OSVDB-3092: GET /css/: This might be interesting...

+ OSVDB-3268: GET /img/: Directory indexing found.

+ OSVDB-3092: GET /img/: This might be interesting...

+ OSVDB-3268: GET /includes/: Directory indexing found.

+ OSVDB-3092: GET /includes/: This might be interesting...

+ OSVDB-3093: GET /admin/index.php: This might be interesting... has been seen in web logs from an unknown scanner.

+ OSVDB-3268: GET /database/: Directory indexing found.

+ OSVDB-3093: GET /database/: Databases? Really??

+ OSVDB-3233: GET /phpinfo.php: PHP is installed, and a test script which runs phpinfo() was found. This gives a lot of system information.

+ OSVDB-3233: GET /info.php: PHP is installed, and a test script which runs phpinfo() was found. This gives a lot of system information.

+ OSVDB-3268: GET /icons/: Directory indexing found.

+ OSVDB-3268: GET /image/: Directory indexing found.

+ GET /admin/admin.php: PHP include error may indicate local or remote file inclusion is possible.

+ OSVDB-9624: GET /admin/admin.php?adminpy=1: PY-Membres 4.2 may allow administrator access.

+ OSVDB-3233: GET /icons/README: Apache default file found.

+ OSVDB-5292: GET /info.php?file=http://cirt.net/rfiinc.txt?: RFI from RSnake's list (<http://ha.ckers.org/weird/rfi-locations.dat>) or from <http://osvdb.org/>

+ GET /login.php: Admin login page/section found.

Extensions

OCSP Must-Staple: NOT SUPPORTED - Extension not found  
Certificate Transparency: NOT SUPPORTED - Extension not found

OCSP Stapling

NOT SUPPORTED - Server did not send back an OCSP response

\* SSLV3 Cipher Suites:

Server rejected all cipher suites.

\* Session Renegotiation:

Client-initiated Renegotiation: OK - Rejected  
Secure Renegotiation: OK - Supported

\* TLSV1\_3 Cipher Suites:

Server rejected all cipher suites.

\* TLS 1.2 Session Resumption Support:

With Session IDs: OK - Supported (5 successful, 0 failed, 0 errors, 5 total attempts).

With TLS Tickets: OK - Supported

\* SSLV2 Cipher Suites:

Server rejected all cipher suites.

\* TLSV1\_2 Cipher Suites:

Forward Secrecy	OK - Supported
RC4	INSECURE - Supported

Preferred:

None - Server followed client cipher suite preference.

Accepted:
